

The Ages of Massive Stars and Young Clusters from Rotating Stellar Models

Sagan Symposium

Timothy Brandt
Institute for Advanced Study

7 May 2015

κ And b, companion to B9 star

Carson et al., 2013, ApJL, 763, 32

“Planet:” $13 M_{\text{Jup}}$? $50 M_{\text{Jup}}$?

“Planet:” $13 M_{\text{Jup}}$? $50 M_{\text{Jup}}$?
Star: 30 Myr? 200 Myr?

“Planet:” $13 M_{\text{Jup}}$? $50 M_{\text{Jup}}$?
 Star: 30 Myr? 200 Myr?

Based on **kinematics**, **H-R diagram placement**

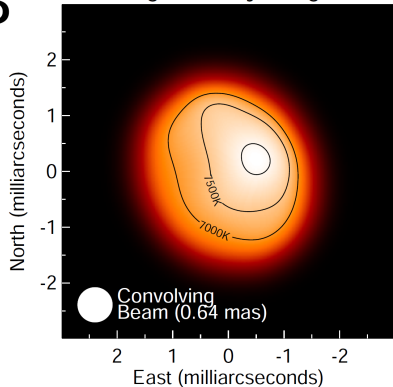

Hinkley et al., 2013, ApJ, 779, 153

Vega and Altair are rotating at $\sim 90\%$ of critical

A Altair Image Reconstruction

B High-Fidelity Image

Monnier et al., 2007, Science, 317, 342

Stars $\gtrsim 1.5 M_{\odot}$ do not spin down

Rapid rotation:

- ① Flattens the star
- ② Produces large pole-equator differences in temperature
- ③ Extends stellar lifetimes
- ④ Increases stellar luminosity

Large rotating evolutionary grids are now available

Georgy et al., 2013, A&A, 553, 24

bayesianstellarparameters.info

Marginalized posterior probability distributions:

How much does it matter? **Case Study: the Hyades**

Perryman et al., 1998, A&A, 331, 81

How much does it matter? **Case Study: the Hyades**

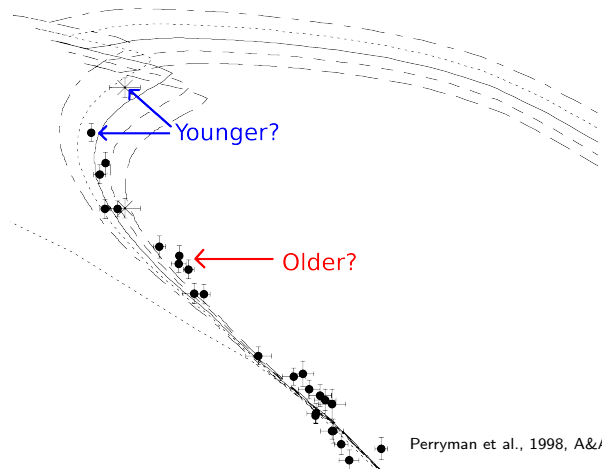

Perryman et al., 1998, A&A, 331, 81

How much does it matter? **Case Study: the Hyades**

Perryman et al., 1998, A&A, 331, 81

How much does it matter? **Case Study: the Hyades**

Now do the Bayesian calculation

Each star: $\mathcal{L}_{\text{star}}(M, Z, \tau, i, \Omega \mid \text{mags}, v \sin i, \varpi)$

Marginalize over $M, i, \Omega \Rightarrow \mathcal{L}_{\text{star}}(Z, \tau)$

$$\mathcal{L}_{\text{cluster}}(Z, \tau) = \prod_{\text{stars}} \mathcal{L}_{\text{star}}(Z, \tau)$$

Prior on Z_{cluster} from FGK members $\Rightarrow \mathbf{p}(\tau)$

Hyades

Praesepe

Hyades

Praesepe

Two Possibilities:

- 1 The Hyades formed over hundreds of Myr
- 2 The stellar models are wrong

Two Possibilities:

- ① The Hyades formed over hundreds of Myr
- ② The stellar models are wrong

Rotation: a **consistent** picture at an **older** age

NGC 1806: LMC cluster

Doesn't match any
isochrone

Two possibilities:

NGC 1806: LMC cluster

Doesn't match any
isochrone

Two possibilities:

- 1 ~300 Myr age range

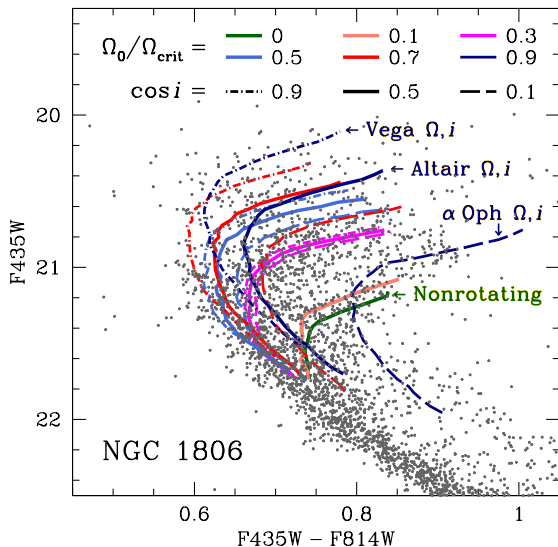

NGC 1806: LMC cluster

Doesn't match any
isochrone

Two possibilities:

- ① ~300 Myr age range
- ② Stellar models are wrong

Rotation is crucial for dating massive stars

- 1 Bayesian ages for your favorite *Hipparcos* A stars
- 2 Consistent ages in the Hyades, Praesepe
- 3 No need for age spread in LMC clusters

Stellar evolution still has surprises!

Thank you
